

PRIORITY DOCUMENT

SUBMITTED OR TRANSMITTED IN COMPLIANCE WITH RULE 17.1(a) OR (b)

The Patent Office Concept House Cardiff Road Newport South Wales NP10 800

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

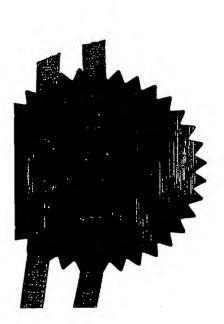

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

- a) If you need help to fill in this form or you have any questions, please contact the Patent Office on 08459 500505.
- b) Write your answers in capital letters using black ink or you may type them.
- c) If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- d) If you have answered YES in part 8, a Patents Form 7/77 will need to be filed.
- e) Once you have filled in the form you must remember to sign and date it.
- Part 7 should only be completed when a divisional application is being made under section 15(4), or when an application is being made under section 2(3), 12(6) or 37(4) following an entitlement dispute. By completing part 7 you are requesting that this application takes the series filling data as a carifer UE application. If you want the new application to have the come:

BLEACHING COMPOSITION

FIELD OF INVENTION

This invention relates to the enhancement of bleaching compositions that are substantially devoid of peroxyl species.

BACKGROUND OF INVENTION

The use of bleaching catalysts for stain removal has been developed over recent years. The recent discovery that some catalysts are capable of bleaching effectively in the absence of an added peroxyl source has recently become the focus of some interest, for example:

W09965905; W00012667; W00012808; W00029537, and,

The shelf life of a product may be regarded as the period of time over which the product may be stored whilst retaining its required quality. A satisfactory shelf life is in many instances a crucial factor for the 20 success of a commercial product. A product with a short shelf life generally dictates that the product is made in small batches and is rapidly sold to the consumer. also a concern to the owners of a brand with a short shelf life that the consumer uses the product within the 25 shelf life otherwise the consumer may be inclined to change to a similar product of another brand. contrast a similar product with a long shelf life may be made in larger batches, held as stock for a longer period of time and the period of time that a consumer stores the 30 product is not of a great concern to the owners of a particular brand.

15

20

30

It is an object of the present invention to provide an air bleaching composition that has improved storage properties.

5 SUMMARY OF INVENTION

We have found that some perfume components degrade per se and reduce the activity of bleaching catalysts over a period of time. We have found that by carefully selecting certain perfume components the stability of a bleaching composition, which is substantially devoid of a peroxygen bleach or a peroxy-based or peroxyl-generating bleach system, is improved. The present invention is applicable to both granular and liquid formulations. However, the present invention has particular utility in liquid bleaching compositions.

The present invention provides for a bleaching composition that comprises a perfume component that does not substantially reduce the activity of a transition metal catalyst that functions as described herein.

The present invention provides a liquid bleaching composition comprising:

25 A liquid bleaching composition comprising:

(a) an organic substance which forms a complex with a transition metal for bleaching a substrate with atmospheric oxygen, the bleaching composition upon addition to an aqueous medium providing an aqueous bleaching medium substantially devoid of a peroxygen bleach or a peroxy-based or peroxyl-generating bleach cystem:

- (b) between 0.001 to 3 wt/wt % of a perfume composition; and,
- (c) the balance carriers and adjunct ingredients to 100 wt/wt % of the total bleaching composition,

wherein the bleaching activity of the beaching composition is greater by a factor of at least 10, in comparison to a same bleaching composition in which a molar equivalent amount of citronellal is present as the perfume composition, after a period of storage at 37 °C for 14 days as measured by exhibited bleaching activity of the transition metal catalyst towards acid blue 45 in the presence of hydrogen peroxide.

15

20

10

Alternatively, beta-carotene may be used as the monitor to measure activity of the catalyst. In instances where the transition metal catalyst exhibits only measurable bleaching activity via air rather than with added peroxyl species, in particular hydrogen peroxide, beta-carotene may be used to determine the relative activity of the transition metal catalyst.

The factor is at least 12, most preferably 15.

25

30

Preferred perfume components may be selected from the group consisting of: Alpha demascone, Delta demascone, Iso E super, Cinnamic aldehyde, Hexylcinnamic aldehyde, Aldehyde butylcinnamic, benzaldehyde, anisique aldehyde, Linalol, Tetrahydrolinalol, Undecavertol, Geraniol, Nerol, Citronellol, citral, Oxyde de Rose, Geranyl acetate, Citronellyl acetate, Coumarine, Linalyl acetate, Geranyl nitrate, Citronellyl nitrile, Cinnamonitrile, and

Citronitrile, Aldehyde Amylcinnamique,

Methylanthranilate, di-Ethyl-Anthranilate, Methyl-nAcetylanthranilate, Diphenyloxide, Verdox, Benzylacetate,
Diola, Orange Cristals, Peonile, Clonal, Limonene,

Camphor, Anthranilate, Di-isobutyl-Anthranilate, Verdyl
Acetate, pinane, veloutone, alpha-methylionone, and
damascenone.

The term "substantially devoid of a peroxygen bleach or a 10 peroxy-based or peroxyl-generating bleach system" should be construed within spirit of the invention. preferred that the composition has as low a content of peroxyl species present as possible. It is preferred that the bleaching formulation contains less that 1 % wt/wt total concentration of peracid or hydrogen peroxide or 15 source thereof, preferably the bleaching formulation . contains less that 0.3 % wt/wt total concentration of peracid or hydrogen peroxide or source thereof, most preferably the bleaching composition is devoid of peracid 20 or hydrogen peroxide or source thereof. In addition, it is preferred that the presence of alkyl hydroperoxides is kept to a minimum in a bleaching composition comprising the ligand or complex of the present invention.

25 The present invention extends to a method of bleaching a substrate/textile with a composition of the present invention. The method comprising the steps of treating a substrate with the bleaching composition in an aqueous environment, rinsing the substrate and drying the substrate.

The present invention also extends to a commercial package together with instructions for its use.

DETAILED DESCRIPTION OF THE INVENTION

STABLE PURFUMES

The following is a list of perfume components that do not unduly effect the stability of an "air" bleaching catalyst in a bleaching formulation.

Alpha demascone

UNSTABLE PURFUMES

The following is a list of perfume components that unduly effect the stability of an "air" bleaching catalyst in a bleaching formulation.

trifernal

THE BLEACH CATALYST

The bleach catalyst per se may be selected from a wide range of transition metal complexes of organic molecules (ligands). In typical washing compositions the level of the organic substance is such that the in-use level is from 0.05 μ M to 50 mM, with preferred in-use levels for domestic laundry operations falling in the range 1 to 100 μ M. Higher levels may be desired and applied in industrial textile bleaching processes. A mixture of different catalysts may be employed in the bleaching composition.

Suitable organic molecules (ligands) for forming 15 complexes and complexes thereof are found, for example in: GB 9906474.3; GB 9907714.1; GB 98309168.7, GB 98309169.5; GB 9027415.0 and GB 9907713.3; DE 19755493; 20 EP 999050; WO-A-9534628; EP-A-458379; EP 0909809; United States Patent 4,728,455; WO-A-98/39098; WO-A-98/39406, WO 9748787, WO 0029537; WO 0052124, and WO0060045 the complexes and organic molecule (ligand) precursors of which are herein incorporated by reference. An example of a preferred catalyst is a transition metal complex of 25 MeN4Py ligand (N, N-bis(pyridin- 2-yl-methyl)-1,1bis (pyridin-2-yl) -1-aminoethane).

The ligand forms a complex with one or more transition metals, in the latter case for example as a dinuclear complex. Suitable transition metals include for example: manganese in oxidation states II-V, iron II-V, copper I-III, cobalt I-III, titanium II-IV, tungsten IV-VI, vanadium II-V and molybdenum II-VI.

An example of a preferred catalyst is a monomer ligand or ... transition metal catalyst thereof of a ligand having the formula (I):

wherein each R is independently selected from: hydrogen,

F, Cl, Br, hydroxyl, C1-C4-alkylO-, -NH-CO-H, -NH-CO-C1C4-alkyl, -NH2, -NH-C1-C4-alkyl, and C1-C4-alkyl;

R1 and R2 are independently selected from:
C1-C4-alkyl,
C6-C10-aryl, and,

a group containing a heteroatom capable of coordinating to a transition metal, wherein at least one of R1 and R2 is the group containing the heteroatom;
R3 and R4 are independently selected from hydrogen, C1-C8 alkyl, C1-C8-alkyl-O-C1-C8-alkyl, C1-C8-alkyl-O-C6-C10-aryl, C6-C10-aryl, C1-C8-hydroxyalkyl, and -(CH2)_nC(O)OR5 wherein R5 is independently selected from: hydrogen, C1-C4-alkyl, n is from 0 to 4, and mixtures thereof; and,

X is selected from C=0, $-[C(R6)_2]_y$ - wherein Y is from 0 to 3 each R6 is independently selected from hydrogen, hydroxyl, C1-C4-alkoxy and C1-C4-alkyl.

5 The transition metal complex preferably is of the general formula (AI):

$[M_aL_kX_n]Y_m$

10 in which:

15

25

30

M represents a metal selected from Mn(II)-(III)(IV)-(V), Cu(I)-(II)-(III), Fe (II)-(III)-(IV)-(V),
Co(I)-(II)-(III), Ti(II)-(III)-(IV), V(II)-(III)-(IV)(V), Mo(II)-(III)-(IV)-(V)-(VI) and W(IV)-(V)-(VI),
preferably from Fe(II)-(III)-(IV)-(V);

L represents the ligand, preferably N,N-bis(pyridin-2-yl-methyl)-1,1-bis(pyridin-2-yl)-1-aminoethane, or its protonated or deprotonated analogue;

X represents a coordinating species selected from 20 any mono, bi or tri charged anions and any neutral molecules able to coordinate the metal in a mono, bi or tridentate manner;

Y represents any non-coordinated counter ion;

a represents an integer from 1 to 10;

k represents an integer from 1 to 10;

n represents zero or an integer from 1 to 10;

m represents zero or an integer from 1 to 20.

BALANCE CARRIERS AND ADJUNCT INGREDIENTS

These are generally surfactants, builders, foam agents, anti-foam agents, solvents, and enzymes. The use and emounts of these components are such that the bleaching

composition performs depending upon economics, environmental factors and use of the bleaching composition.

The air bleach catalyst may be used in a detergent composition specifically suited for stain bleaching purposes, and this constitutes a second aspect of the invention. To that extent, the composition comprises a surfactant and optionally other conventional detergent ingredients. The invention in its second aspect provides 10 an enzymatic detergent composition which comprises from 0.1 - 50 % by weight, based on the total detergent composition, of one or more surfactants. This surfactant system may in turn comprise 0 - 95 % by weight of one or more anionic surfactants and 5 to 100 % by weight of one 15 or more nonionic surfactants. The surfactant system may additionally contain amphoteric or zwitterionic detergent compounds, but this in not normally desired owing to their relatively high cost. The enzymatic detergent composition according to the invention will generally be 20 used as a dilution in water of about 0.05 to 2%.

In general, the nonionic and anionic surfactants of the surfactant system may be chosen from the surfactants

described "Surface Active Agents" Vol. 1, by Schwartz & Perry, Interscience 1949, Vol. 2 by Schwartz, Perry & Berch, Interscience 1958, in the current edition of "McCutcheon's Emulsifiers and Detergents" published by Manufacturing Confectioners Company or in

"Tenside-Taschenbuch", H. Stache, 2nd Edn., Carl Hauser Verlag, 1981.

10

15

20

25

30

Suitable nonionic detergent compounds which may be used include, in particular, the reaction products of compounds having a hydrophobic group and a reactive hydrogen atom, for example, aliphatic alcohols, acids, amides or alkyl phenols with alkylene oxides, especially ethylene oxide either alone or with propylene oxide. Specific nonionic detergent compounds are C_6-C_{22} alkyl phenol-ethylene oxide condensates, generally 5 to 25 EO, i.e. 5 to 25 units of ethylene oxide per molecule, and the condensation products of aliphatic C_8-C_{18} primary or secondary linear or branched alcohols with ethylene oxide, generally 5 to 40 EO.

Suitable anionic detergent compounds which may be used are usually water-soluble alkali metal salts of organic sulphates and sulphonates having alkyl radicals containing from about 8 to about 22 carbon atoms, the term alkyl being used to include the alkyl portion of higher acyl radicals. Examples of suitable synthetic anionic detergent compounds are sodium and potassium alkyl sulphates, especially those obtained by sulphating higher C₈-C₁₈ alcohols, produced for example from tallow or coconut oil, sodium and potassium alkyl C9-C20 benzene sulphonates, particularly sodium linear secondary alkyl C₁₀-C₁₅ benzene sulphonates; and sodium alkyl glyceryl ether sulphates, especially those ethers of the higher alcohols derived from tallow or coconut oil and synthetic alcohols derived from petroleum. The preferred anionic detergent compounds are sodium C11-C15 alkyl benzene sulphonates and sodium C_{12} - C_{18} alkyl sulphates. Also applicable are surfactants such as those described in

20

25

EP-A-328 177 (Unilever), which show resistance to salting-out, the alkyl polyglycoside surfactants described in EP-A-070 074, and alkyl monoglycosides.

5 Preferred surfactant systems are mixtures of anionic with nonionic detergent active materials, in particular the groups and examples of anionic and nonionic surfactants pointed out in EP-A-346 995 (Unilever). Especially preferred is surfactant system that is a mixture of an alkali metal salt of a C₁₆-C₁₈ primary alcohol sulphate together with a C₁₂-C₁₅ primary alcohol 3-7 EO ethoxylate.

The nonionic detergent is preferably present in amounts greater than 10%, e.g. 25-90% by weight of the surfactant system. Anionic surfactants can be present for example in amounts in the range from about 5% to about 40% by weight of the surfactant system.

One skilled in the art will appreciate that some adventitious peroxyl species may be in the composition nevertheless it is most preferred that the bleaching composition of the present invention has less that 1%, preferably less than 0.1%, most preferably less than 0.01%, of a peroxyl species present. These adventitious peroxyl are predominantly alkyl hydroperoxides formed by autoxidation of the surfactants.

The composition may contain additional enzymes as found in WO 01/00768 A1 page 15, line 25 to page 19, line 29, the contents of which are herein incorporated by reference.

10

15

Builders, polymers and other enzymes as optional ingredients may also be present as found in WO0060045.

Suitable detergency builders as optional ingredients may also be present as found in WO0034427.

The composition of the present invention may be used for laundry cleaning, hard surface cleaning (including cleaning of lavatories, kitchen work surfaces, floors, mechanical ware washing etc.). As is generally known in the art, bleaching compositions are also employed in waste-water treatment, pulp bleaching during the manufacture of paper, leather manufacture, dye transfer inhibition, food processing, starch bleaching, sterilisation, whitening in oral hygiene preparations and/or contact lens disinfection.

In the context of the present invention, bleaching should be understood as relating generally to the decolourisation of stains or of other materials attached 20 to or associated with a substrate. However, it is envisaged that the present invention can be applied where a requirement is the removal and/or neutralisation by an oxidative bleaching reaction of malodours or other undesirable components attached to or otherwise 25 associated with a substrate. Furthermore, in the context of the present invention bleaching is to be understood as being restricted to any bleaching mechanism or process that does not require the presence of light or activation by light. 30

BLEACHING FORMULATION

The present invention has particular utility for liquid formulations because in contrast to a solid heterogeneous mixture in a liquid formulation the contact between individual components are more intimate and hence more susceptible to degradation due to interaction of components.

There are many commercial liquid formulations for

detergents and rinse conditioners or other liquid

products that may be enhanced by conferring a bleaching

ability to the liquid formulation. As will be evident to

one skilled in the art the present invention is

applicable to known liquid formulations and liquid

formulations to be developed.

The level of the catalyst in a commercial bleaching composition is from 0.0001 to 0.6 wt/wt %, preferably 0.001 to 0.15 wt/wt %, most preferably 0.01 to 0.1 wt/wt.

We have found that the level of catalyst is optimum between 0.03 to 0.09 wt/wt % in the commercial bleaching composition.

The present invention extends to both isotropic and
complex liquid compositions and formulations a brief
discussion of which follows. Some isotropic formulations
are termed 'micro-emulsion' liquids that are clear and
thermodynamically stable over a specified temperature
range. The 'micro-emulsion' formulation may be water in
oil, or oil in water emulsions. Some liquid formulations
are macro-emulsions that are not clear and isotropic.
Emulsions are considered meta-stable. Concentrated, clear
compositions containing fabric softening actives have

been disclosed in WO 98/08924 and WO 98/4799, both Procter & Gamble. Such compositions comprise biodegradable fabric conditioners. However, both disclose compositions comprising water miscible solvents that do not form water-in-oil micro-emulsions. Clear fabric 5 conditioning compositions have also been disclosed in EP 730023 (Colgate Palmolive), WO 96/19552 (Colgate Palmolive), WO 96/33800 (Witco Co.), WO 97/03170 (Procter & Gamble), WO 97/03172 (Procter & Gamble), WO 97/03169 (Procter & Gamble), US 5492636 (Quest Int.) and 10 US 5427697 (Procter & Gamble). Liquid formulations of the present invention may contain for example; monoethoxy quats; AQAs and bis-AQAs; cationic amides; cationic esters; amino/diamino quats; glucamide; amine oxides; ethoxylated polyethyleneimines; enhancement polymers of 15 the form linear amine based polymers, e.g. bishexamethylenetriamine; polyamines e.g. TETA, TEPA or PEI polymers.

The liquid may be contained within a sachet as found in WO02/068577.

The following is an example of a liquid bleaching composition to which an organic substance which forms a complex with a transition metal for bleaching a substrate with atmospheric oxygen may be added together with the selected stable perfume components.

Ingredient	Wt%
Nonionic surfactant	26.6
Monopropylene glycol	5.5
Pigment premix	0.017
Glycerol	21.36
Monoethanolamine	7.56
Oleic fatty acid	13.10
Water	Up to 100
Linear alkyl benzene	20.1
sulfonate	
Perfume	1.6
Protease Enzyme	1.0

The following are further examples of commercial liquid formulations that the present invention may be incorporated into: WiskTM liquid USA, 1999, OMOTM liquid NL, 1999, OMO-liquidoTM Brazil, 1999, and Rinse conditioner (RobijnTM - NL). In this regard, that catalyst is added together with the selected stable perfume components.

The following is a further example of a commercial liquid formulation that the present invention may be incorporated into by adding the catalyst together with the selected stable perfume components. The commercial liquid formulation has a pH of 7.

Sodium citrate:	3.2 %
Polypropylene glycol:	4.75 %
LAS-acid:	5.6 %
NI 25 9 EO:	6.6 %
LES (anionic sufactant):	10.5 %
Borax:	2.30 %
Sorbitol:	3.35 %
Alcosperce 725:	0.30 %
Coconut fatty acid:	0. 73 %
Monoethanolamine:	0.20 %
Fluorescer:	0.125 %
Enzymes	-
Perfume/dye	-

It is most preferred that when the catalyst is in a liquid composition, the liquid composition has a pH of 7 or below irrespective.

The following catalyst was used in the experiments 9,9-dihydroxy-2,4-di-(2-pyridyl)-3-methyl-7-(pyridin-2-ylmethyl)-3,7-diaza-bicyclo[3.3.1]nonane-1,5-dicarboxylate Iron (II) dichloride was prepared as described by Heidi Borzel, Peter Comba, Karl S. Hagen, Yaroslaw D. Lampeka, Achim Lienke, Gerald Linti, Michael Merz, Hans Pritzkow, Lyudmyla V. Tsymbal in Inorganica Chimica Acta 337 (2002) 407 - 419. WO0248301 provides synthetic details of similar compounds.

Liquid compositions containing 0.03 % wt/wt of a bleach component and 0.06 % wt/wt of individual perfume

20

components are stored in glass vials for 14 days at 37 °C in a cabinet.

The activities were determined at 40 °C in a H2O2 containing NaH2PO4.H2O pH7 buffer and Acid Blue 45 (CAS No. 2861-02-1) as substrate using the following protocol.

Samples of 70 mg liquid were diluted in 10.00 ml MilliQ water. We added 45 μ l of this solution to an assay of 230 μ L containing 20 mM H2O2, 75 μ M Acid blue 45 and 54 mM NaH2PO4.H2O pH7 buffer.

The solutions were mixed and pre incubated for 1 min at 40 °C. The changes in absorbance at 600 nm were measured for 8 min at 40 °C using a spectrophotometer.

The absolute changes in absorbance were correlated to activities obtained with freshly prepared calibration samples. The measured activities were expressed as \$\mu \text{MOl/1/.}\$

Table 1: The residual activity of 0.03 % wt/wt of a transition metal catalyst after 2 weeks storage at 37 °C.

We claim:

- 1. A bleaching composition comprising:
- 5 (a) an organic substance which forms a complex with a transition metal for bleaching a substrate with atmospheric oxygen, the bleaching composition upon addition to an aqueous medium providing an aqueous bleaching medium substantially devoid of a peroxygen bleach or a peroxy-based or peroxyl-generating bleach system;
 - (b) between 0.001 to 3 wt/wt % of a perfume composition; and,

(c) the balance carriers and adjunct ingredients to 100 wt/wt % of the total bleaching composition,

wherein the bleaching activity of the liquid beaching composition is greater by a factor of at least 10, in comparison to a same bleaching composition in which a molar equivalent amount of citronellal is present as the perfume composition, after a period of storage at 37 °C for 14 days as measured by exhibited bleaching activity of the transition metal catalyst towards acid blue 45 in the presence of hydrogen peroxide or as measured by exhibited bleaching activity of the transition metal catalyst towards beta-carotene in absence of peroxyl species.

2. A bleaching composition comprising according to claim 1, wherein the beaching composition has a greater bleaching activity by a factor of at least 15.

- A bleaching composition comprising according to claim 1, wherein the perfume comprises a perfume component selected from the group consisting of: Alpha demascone, Delta demascone, Iso E super, Cinnamic aldehyde, Hexylcinnamic aldehyde, Aldehyde butylcinnamic, 5 benzaldehyde, anisique aldehyde, Linalol, Tetrahydrolinalol, Undecavertol, Geraniol, Nerol, Citronellol, citral, Oxyde de Rose, Geranyl acetate, Citronellyl acetate, Coumarine, Linalyl acetate, Geranyl nitrate, Citronellyl nitrile, Cinnamonitrile, and 10 Citronitrile, Aldehyde Amylcinnamique, Methylanthranilate, di-ethyl-Anthranilate, Methyl-n-Acetylanthranilate, Diphenyloxide, Verdox, Benzylacetate, Diola, Orange Cristals, Peonile, Clonal, Limonene, Camphor, Anthranilate, Di-isobutyl-Anthranilate, Verdyl 15 Acetate, pinane, veloutone, alpha-methylionone, and damascenone.
- A bleaching composition according to any one of
 claims 1 to 3, comprising between 0.05 to 2 wt/wt % of a perfume composition.
 - 5. A liquid bleaching composition according to any preceding claim, wherein the bleaching composition has a pH of 10 or below.
 - 6. A liquid bleaching composition according claim 5, wherein the liquid bleaching composition has a pH in the range of 6 to 9.

7. A bleaching composition according to any preceding claim, wherein the organic substance is of the

8. A method of bleaching a textile stain, comprising the steps of treating a substrate with the bleaching composition as defined in any preceding claim in an aqueous environment, rinsing the substrate and drying the

10

substrate.

Abstract of the Invention

The present invention concerns the preservation of a catalyst in a bleaching composition. The bleaching composition is substantially devoid of a peroxygen bleach or a peroxy-based or peroxyl-generating bleach system.
